Title: **Adult lifetime predation of *Tuta absoluta* eggs by three Neotropical mirid predators on tomato**

Authors: **Joop C. VAN LENTEREN, Vanda Helena Paes BUENO, Flavio Cardoso MONTES, Lia HEMERIK, Peter W. DE JONG**

Bulletin of Insectology, Volume 71 December 2018 pages 179-188

**Procedure followed to obtain lifetables for females and males of *Campyloneuropsis infumatus*, *Engytatus varians* and *Macrolophus basicornis* on tomato**

As explained in the section “*Total egg predation by mirid adults*” in Material and Methods, we started with measuring the predation by *a couple* of predators during the first 7 days of their adult life, and the results are presented in **table S1**.

After 7 days, males and females were separated and predation of males and females was determined until they died (**table S2**).

Then, we calculated daily predation by males and females during day 8-17, i.e. the first ten days after males and females were separated. We used this period to obtain sufficient replicates and to prevent the effect of decreasing predation rates of females at the end of the adult life (see figures 1-3 in the main text of the paper). Next, the total number of *T. absoluta* eggs eaten by males and females during these ten days were used to calculate the percentages eggs eaten by the two sexes (**table S3**).

The percentages were then applied to the predation rates of couples during the first 7 days in order to obtain separate estimates for male and female predation rates; “partial” eggs were rounded off (**table S4**). The combination of **table S4** (predation during the first 7 days estimated for males and females) and **table S2** (predation rates for males and females from day 8 until death) provides the complete predation data for males and females during their adult life and is presented as table 1 in the main text of the paper.

Index of supplemental tables:

	Page
<b>Table S1.</b> Daily predation rates of couples of <i>Campyloneuropsis infumatus</i> , <i>Engytatus varians</i> and <i>Macrolophus basicornis</i> during the first 7 days of adult life. * = day on which male died, ** = day on which female died.....	2
<b>Table S2.</b> Daily predation rates of males and females of <i>Campyloneuropsis infumatus</i> , <i>Engytatus varians</i> and <i>Macrolophus basicornis</i> from day 8 until death.....	3
<b>Table S3.</b> Average daily predation data of males and females of <i>Campyloneuropsis infumatus</i> , <i>Engytatus varians</i> and <i>Macrolophus basicornis</i> from day 8-17.....	9
<b>Table S4.</b> Estimated daily predation rates for male and female <i>Campyloneuropsis infumatus</i> , <i>Engytatus varians</i> and <i>Macrolophus basicornis</i> during the first 7 days of adult life.....	10

**Table S1.** Daily predation rates of couples of *Campyloneuropsis infumatus*, *Engytatus varians* and *Macrolophus basicornis* during the first 7 days of adult life. \* = day on which male died, \*\* = day on which female died.

**Table S3.** Average daily predation data of males and females of *Campyloneuropsis infumatus*, *Engytatus varians* and *Macrolophus basicornis* from day 8-17.

Mirid species	Average number of <i>T. absoluta</i> eggs eaten per day by			Percentage of <i>T. absoluta</i> eggs eaten per day by	
	Males	Females	Total	Males	Females
<i>Campyloneuropsis infumatus</i>	13.0	37.8	50.8	25.6	74.4
<i>Engytatus varians</i>	18.5	52.2	70.7	26.2	73.8
<i>Macrolophus basicornis</i>	11.6	38.1	49.7	23.3	76.7

**Table S4.** Estimated daily predation rates for male and female *Campyloneuropsis infumatus*, *Engytatus varians* and *Macrolophus basicornis* during the first 7 days of adult life.

***Campyloneuropsis infumatus* predation by females**
